The object model provides classes for drawing, dimensioning, editing, running reports and layout, in addition to creating and working with auxiliary data. AutoCAD Architecture 2010 has been released with five objects: ArchitectureElement, ArchitectureEntity, Layout, SubType and Type. With AutoCAD Architecture 2009, these objects were called ArchitectureElement, ArchitectureEntity, ArchitectureEntity, Layout and Section. AutoCAD Architecture elements A drawing consists of a number of elements: geometry, text, block numbers, blocks, text styles, entities, properties, layers, data fields, layer styles, styles, graphics, symbols, and components. These elements are organized into a tree, with different objects of the same type having a parent and children. For example, an ArchitectureEntity is the root node, and all its children are ArchitectureElements (such as Buildings, Structures, etc.). Elements are not strictly ordered in the tree, and can be sorted, moved, inserted, and deleted as appropriate. A drawing can be created in several ways: An existing drawing can be used, using the Load From Drawing command. A DWG file can be imported using the Import From DWG command. An XSLT style can be created using the Application button, and then used to apply a drawing style to an existing drawing using the Applying a Style to an Existing Drawing command.
